On-Demand

An **On-Demand** event trigger executes when the Fire Trigger option is used from the Workbench Projects window or from another trigger using the Fire Trigger action.

Defining an on-demand event trigger

To define an on-demand event trigger, follow these steps:

1. From the Workbench left pane, expand the node where you want to define the on-demand event trigger.
2. Select the **Project** icon to display the **Projects** window, right click a specific project tab to display its pop-up menu, and then select **New**.
You also can select the **New** button at the bottom of the **Projects** window when a specific project tab has already been selected.
3. The new **Trigger** window appears.
Name the trigger. The trigger name can be up to 64 characters and include letters, numbers, and the underscore character. Spaces are allowed.
4. From the **Event** tab, select the **Trigger Event Type** down-arrow, and then select **On-Demand**.

The **Event** tab becomes active for the on-demand event, but there are no additional parameters to define.

On-Demand event type trigger event variables

There are no event variables for an on-demand event trigger.

Complete the trigger definition

Complete the definition of the trigger, including the follow trigger components:

- The trigger's [actions](#)
- The trigger's [local variables](#), [static variables](#), [macros](#) and [event variables](#)
- The trigger's [settings](#).

Use the **Validate** button to check the parameters and then the **Save** button to save the trigger's definition. The trigger will be listed in the Project's tab list of triggers in the **Stopped** state.
